Course Information

The increased use of AI across different organizations advocates for robust regulations, standards, and frameworks. These standards set the rules for organizations to create an AI governance framework. ISO 42001 is one such standard developed by the International Organization for Standardisation. This standard lays out the guidelines and requirements with which organizations can implement the AI governance framework.

Through this course, learning and development experts at Exoexcellence Consultants have presented the basic nuance of this standard by discussing the use of AI in organizations, giving an overview of AI governance, and discussing the special considerations in ISO 42001. Special emphasis is put on incorporating the PDCA cycle and how it corresponds with the requirements of this standard.

The course also looks at the strategies, such as understanding the scope of the standard and the role of organizational leadership in implementing the standard. Similarly, it looks at the importance of risk treatment and risk assessment in aligning with the standard. In short, this course is an excellent resource for those wanting to enter the AI regulation world. It will orient them with this basic knowledge, allowing them to move further in their journey with ease.

Modules Studied

Module 1: Connecting AI Governance with ISO 42001

Module 2: Course assessment
